

Dear KEMP team,

A number of questions have come from our customers regarding KEMP's response to Microsoft setting Forefront TMG to EOS as of Dec 1st 2012.

This email should be treated as our official response and should be used when responding to future questions.

- KEMP is committed to supporting its partners, especially those who have been marketing LoadMaster and TMG together as a complete solution.
- KEMP is actively working on new features that will help customers looking for an alternative to (or transitioning from) TMG.
- LoadMaster will be extended to support the following features :
 - End Point Authentication for Pre-Auth
 - Persistent Logging and Reporting for a new User Log
 - LDAP and Kerberos communication from the LoadMaster to the Active Directory
 - NTLM and Basic authentication communication from a Client to the LoadMaster
 - RADIUS communication from LoadMaster to a RADIUS server
 - Single Sign On across Virtual Services

Feedback would be gratefully received from any team members or customers.

There is no exact timeline but the initial release target is end of Q1 2013.

This statement and the exact list of features is subject to change until RTM.

Kind Regards,

Product Management
